

THE AIM OF THE STUDY WAS TO LEARN:

 How men's circumcision status impacts their sexual partners, with a focus on sexual functioning, sexual satisfaction, general preferences for circumcision status, and beliefs about circumcision status.

WHAT IS MALE CIRCUMCISION?

Male circumcision occurs when some or all of the prepuce or penile foreskin is removed, resulting in a change to the anatomic structure of the penis.

METHODS:

- 196 people over the age of 18 who were in a relationship with a cisgender male partner for at least 3 months were recruited for the study.
- They completed a variety of self-report measures assessing sexuality and circumcision variables.

 (1) The presence or absence of foreskin did not impact sexual functioning of partners, whether they (3) Women reported a preference towards circumcised partners for vaginal intercourse and fellatio, with <u>no significant</u> preference towards circumcision status regarding anal intercourse or manual stimulation of their partners' genitals.

were women or men.

(2) Women with circumcised partners were **significantly more satisfied** with their partners' circumcision status <u>when flaccid</u> compared to women with intact partners.

In contrast, <u>men with intact</u> <u>partners</u> reported **higher levels of satisfaction** with their partners' circumcision status compared to those with circumcised partners. Men expressed a strong preference for sex with intact partners for anal intercourse, fellatio, and manual stimulation of their partners' genitals.

(4) Women attributed more **positive health-related** views of male genitals to circumcised penises, whereas, men indicated that circumcision status was <u>not</u> relevant for the same healthrelated factors.

Future research should use **qualitative research methods** to **explore variables that influence** self-reported **circumcision status preference for sexual acts.**

The information presented is based on the publication "You either have it or you don't: The impact of male circumcision status on sexual" (Bossio, Pukall, & Bartley, 2015). Abstract available at https://www.utpjournals.press/doi/abs/10.3138/cjhs.242-A2
